Which Sprayer to Use?

Many Chemical Companies manufacture products without giving much thought how to dispense it?

Thus the challenge we all face !

Best Shop Practices...

Original

50100

Performance

50800

Technology

50330

Problem...

In many situations compressed sprayers equipped with VITON and /or EPDM seals will not work with certain chemicals due to an incompatibility issue. To further this concern, it appears that when some chemicals are blended they produce reactive agents, and sealing materials tend to fail over time. Sprayers that were compatible with chemicals in the past are now breaking down due to changes in formulas imposed by the VOC regulations.

Plastic components also degrade when exposed to products like mineral spirits, paint thinners, toluene and acetone to name a few.

Solution...

The 50330 Super Sprayer MAXI offers the refinish industry, automotive repair and detail, marine, aviation and industrial sectors a tool that will perform well with chemicals where standard compression sprayers fail.
